How Does a Trie Work?

A trie stores strings in a tree-like format where each level corresponds to a character position in the string.

- Insert: To add a string, traverse the tree following the characters. Create nodes as needed.
- Search: To locate a string, traverse the nodes matching the string's characters.
- Prefix Search: To find all strings starting with a prefix, traverse to the prefix node and explore all descendants.

Variations and Types of Tries

Compressed Trie (Radix Tree)

A compressed trie merges chains of single-child nodes into a single node to save space and improve efficiency. It is particularly useful for large datasets.

Suffix Tree and Suffix Array
